Dynamics and Challenges in the Energy Market

EP Innovation Centre

Dynamics and Challenges in the Energy Market

Changes in the EU Supply and Demand

EU quarterly imports by source

Europe's LNG regasification capacity and demand outlook

● LNG capacity ● 2024 LNG demand forecast* ● Historical gas consumption ● Gas consumption forecast

Source: Gas Infrastructure Europe, Kpler, IEEFA • Includes EU27, UK, Türkiye, Norway.
*Gas and LNG demand forecasts based on IEEFA analysis.

<https://www.bruegel.org/dataset/european-natural-gas-imports>

<https://ieefa.org/european-lng-tracker>

EU Balancing Mechanism: from Fuel switching to JKM-TTF spread

1. EU switching range links gas to coal & CO2 prices; impact diminishes into 2030s as coal closes

2. US SRMC dynamic range driven by HH & shipping costs; provides key global price support

3. Asian LNG demand response key source of flex across all price levels (and growing in importance as (i) Asian spot procurement increases (ii) European CTGS channel shrinks)

*Indicative switching channel for 50-52 % efficient gas plants vs 38-45% efficient coal plants

Thanks to **RES and supply changes** ratio between gas and power moves is changing

Used to be: **Power price = 2 * Gas price + 0.4 * Carbon price**

The **coal and lignite phaseout** will reduce thermal / **fuel switching capacity**.

EU is now more reliant on LNG, with the **JKM-TTF** price spread becoming a key balancing mechanism.

<https://timera-energy.com/blog/what-is-setting-global-gas-prices/>

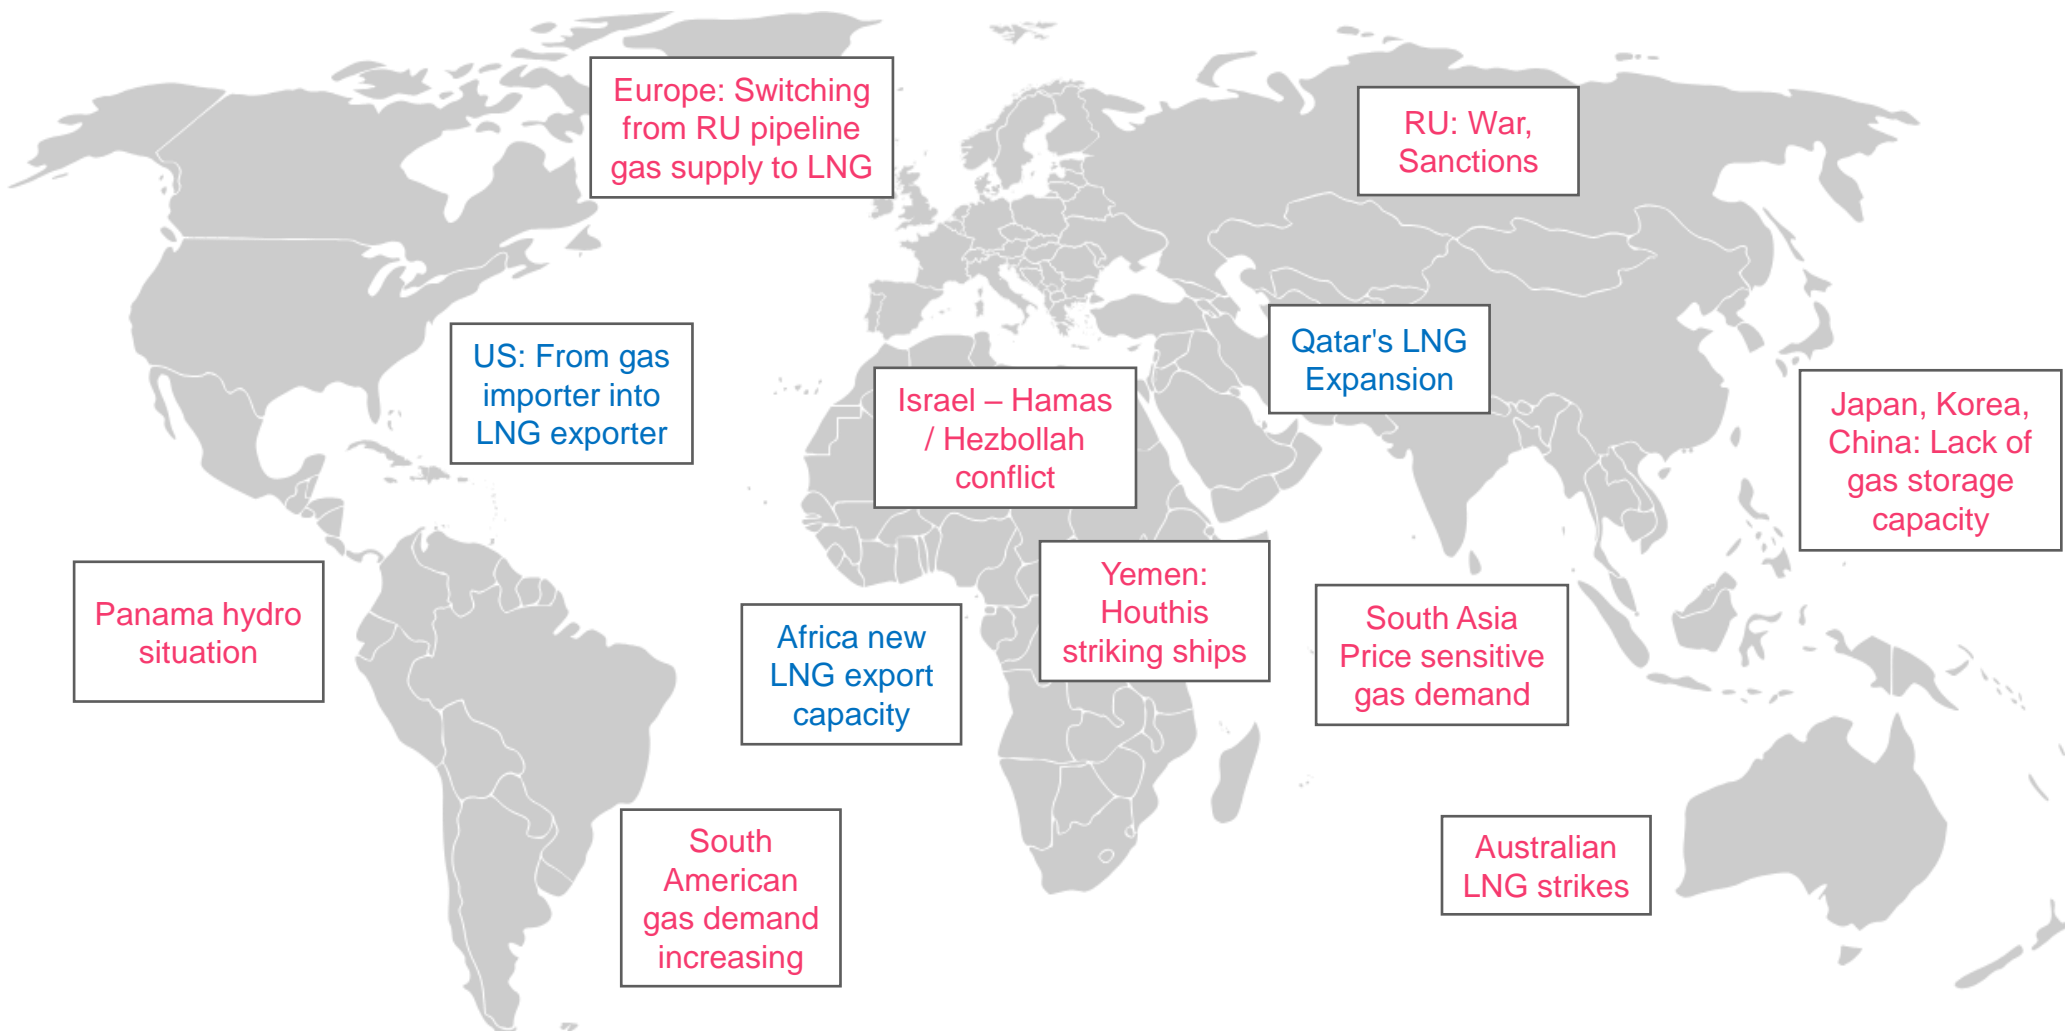

<https://timera-energy.com/blog/asian-demand-flex-is-setting-global-gas-prices/>

The Influence of Geopolitics on Energy Markets

Pipeline gas generally results in lower price volatility.

Increased reliance on LNG can cause price fluctuations of tens of percent in a single day.

Higher volatility may lead to unpredictable energy costs, impacting demand for consumers, industries, and the power sector.

Trends, Problems & **EPIC** research gaps

EP Innovation Centre

Importance of Energy for Innovation

Will we be able to change our behavior and meet our energy needs?

The History of INNOVATION CYCLES

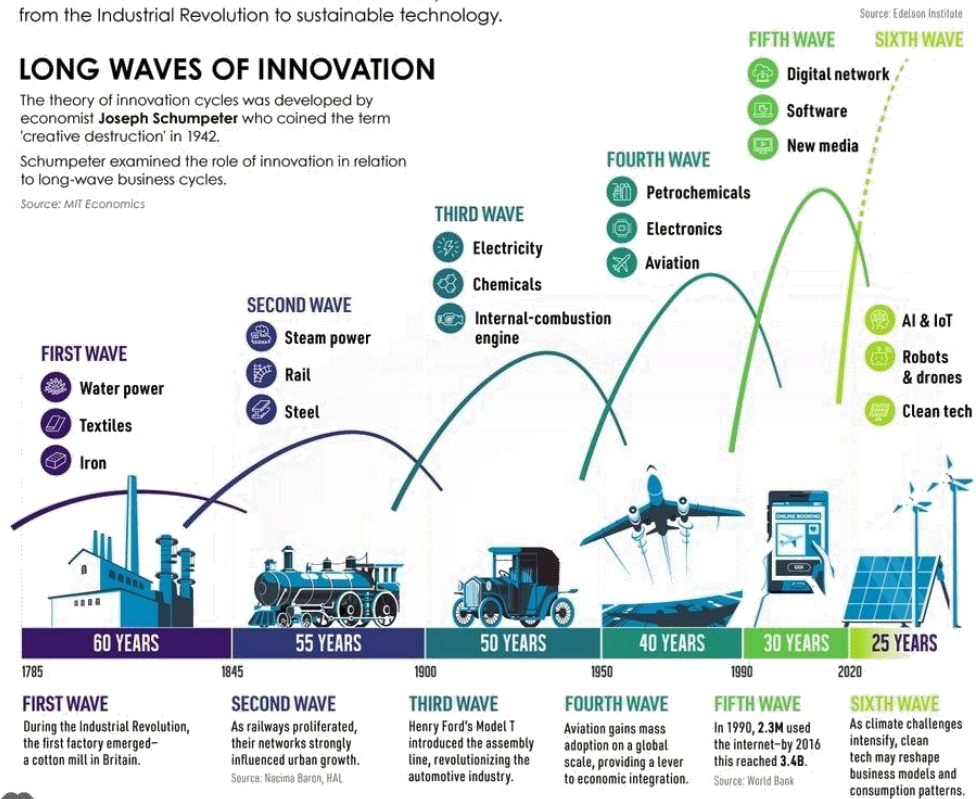

Below, we show waves of innovation across 250 years, from the Industrial Revolution to sustainable technology.

LONG WAVES OF INNOVATION

The theory of innovation cycles was developed by economist **Joseph Schumpeter** who coined the term 'creative destruction' in 1942.

Schumpeter examined the role of innovation in relation to long-wave business cycles.

Source: MIT Economics

Electricity & Income (per capita, all countries)

Climate change

Affecting both the supply and demand sides

Supply: Hot weather leads to reduced thermal production, weather extremes causing unpredictable output.

Demand: Warmer winters reduce heating demand, while hot summers increase cooling demand

40C+ heatwave moves east, fuelling Balkan power market gains

(Montel) Electricity prices are set to jump in the Balkans this week as the recent 40C+ heatwave moves east, while the strained grids of Italy and Spain should experience relief as temperatures there ease.

New record daily global average temperature reached in July 2024

Home / News

25th July 2024

Facebook Twitter LinkedIn

WHAT CAUSED THIS NEW RECORD GLOBAL AVERAGE TEMPERATURE? | WAS THIS EXPECTED? | WHAT CAN BE EXPECTED IN THE COMING DAYS AND WEEKS? | IS 2024 LIKELY TO BE THE WARMEST YEAR ON RECORD? | WHAT WAS THE PREVIOUS RECORD?

This article was originally published on 23 July 2024, and has been updated on 24 and 25 July 2024 to reflect the latest statistics and records.

The Earth has just experienced its warmest day in recent history, according to the Copernicus Climate Change Service (C3S) data. On 22 July 2024, the daily global average temperature reached a new record high in the ERA5 dataset*, at 17.16°C. This exceeds the previous records of 17.09°C, set just one day before on 21 July 2024, and 17.08°C, set a year earlier on 6 July 2023.

Based on data released by C3S on 25 July, Monday 22 July was the hottest day in the ERA5 dataset, which begins in 1940. The temperature on 23 July was very similar, at 17.15°C**.

While the temperature on 21 July 2024 (17.09°C) was almost indistinguishable from the previous record of 17.08°C reached on 6 July 2023, the difference between these and the new record temperature (17.16°C) reached on 22 July is larger than typical differences in day-to-day variations among alternative datasets.

What really stands out is also the difference between the temperatures since July 2023 and all previous years. The data can be explored in Climate Pulse, the C3S application that provides historical and near-real-time temperature data from the ERA5 reanalysis dataset.

Daily global surface air temperature

The graph shows the daily global surface air temperature from January to July 2024. The y-axis represents temperature in degrees Celsius, ranging from 11 to 17. The x-axis represents months from Jan to Dec. A shaded area represents the historical range of temperatures. A red line shows the temperature in 2024, which is significantly higher than the historical range, peaking at 17.16°C on July 22, 2024. Other notable peaks are marked for 17.09°C on July 21, 2024, and 17.08°C on July 6, 2023.

Data for 2024 shown up to 23 July. Data for 23 July 2024 is preliminary.
Data source: ERA5 - Copernicus Climate Change Service

Partners: Copernicus, EUMETSAT, ECMWF, Copernicus Climate Change Service

Climate Pulse, C3S's new tool to monitor the state of our climate at a glance

The record high global average temperatures observed in 2023 have shown the importance of closely monitoring our climate.

July 2023 sees multiple global temperature records broken

Following the hottest June on record and a series of extreme weather events, including heatwaves in Europe, North America and Asia, and wildfires in Canada and Greece, ERA5 data from C3S show that the first three weeks of July have already broken several significant records.

EU The Nuclear Aged

Old nuclear = higher risk / unexpected maintenance => volatile / higher prices?
 Is there any near-term solution? Emerging technologies (SMR, etc.), policies / price guaranties

95 of the 109 nuclear reactors
 in the EU and UK are 30 years or older ...

Two reactors – one each in Finland and Slovakia started up in 2023.

... of which:
 63 are 30-40 years old ...

... and 32 are older than 40 years.

The oldest reactor in the EU is the Netherlands' Borssele at 50 years old.

Extending the lifetime of existing **nuclear power** plants is much cheaper than constructing new ones.

Extending the lifetime of nuclear power plants is also cheaper than constructing new solar or wind **renewable energy** plants.

Constructing new nuclear power plants is cheaper than continuing to invest in **non-renewable** fossil fuel energy.

Energy Transition: Rejected Energy

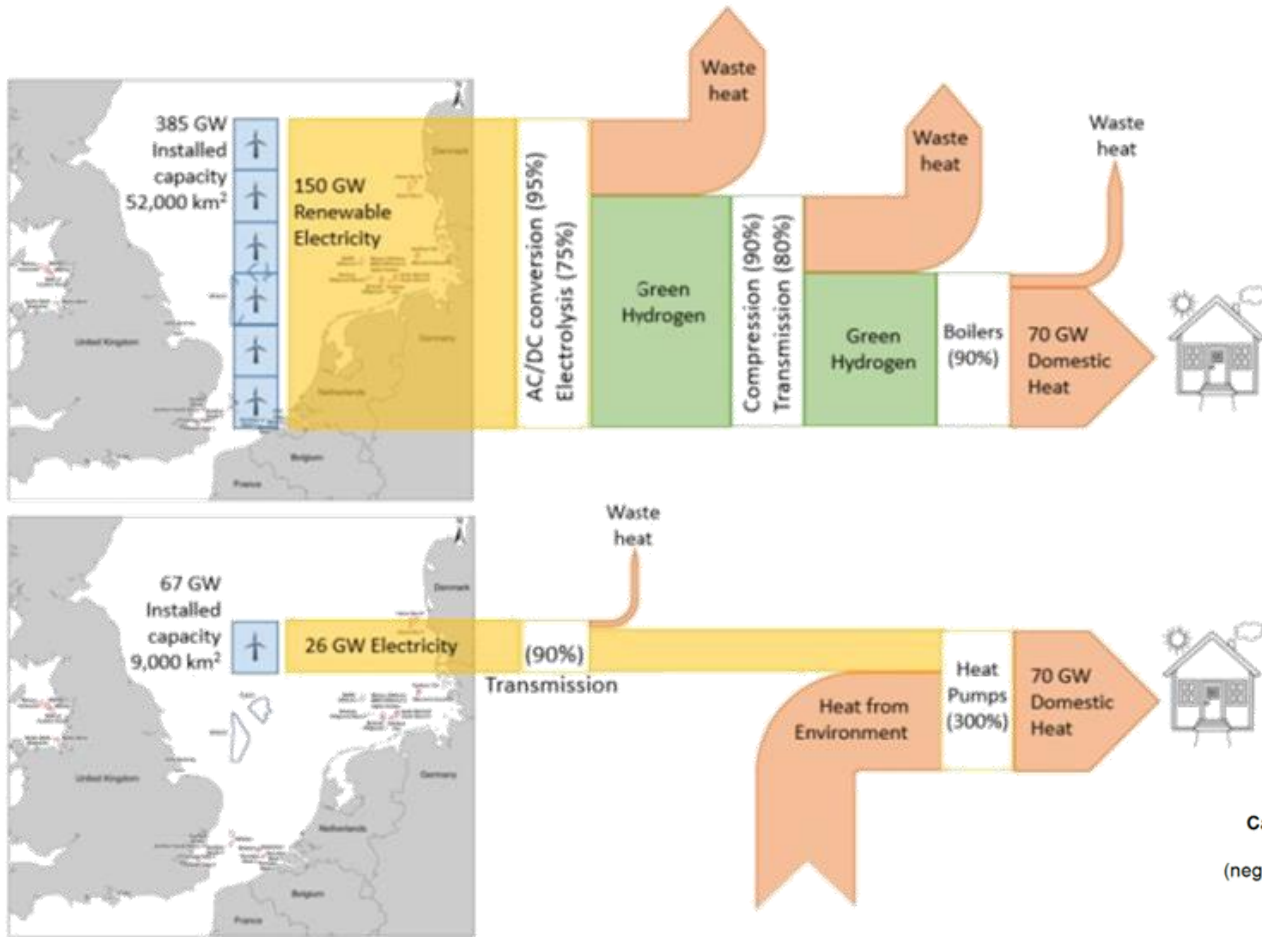

We only need to replace one-third of our current fossil fuel usage.

Source: LLNL March, 2022. Data is based on DOE/EIA MER (2021). If this information or a reproduction of it is used, credit must be given to the Lawrence Livermore National Laboratory and the Department of Energy, under whose auspices the work was performed. Distributed electricity represents only retail electricity sales and does not include self-generation. EIA reports consumption of renewable resources (i.e., hydro, wind, geothermal and solar) for electricity in BTU-equivalent values by assuming a typical fossil fuel plant heat rate. The efficiency of electricity production is calculated as the total retail electricity delivered divided by the primary energy input into electricity generation. End use efficiency is estimated as 65% for the residential sector, 65% for the commercial sector, 21% for the transportation sector and 49% for the industrial sector, which was updated in 2017 to reflect DOE's analysis of manufacturing. Totals may not equal sum of components due to independent rounding. LLNL-MI-410527

New Technologies: Heat pumps, Hydrogen and future trends

We are changing the supply side – will we be able to change the demand side as well?
 If not / not quick enough, how can we store excess energy for times when we need it?"

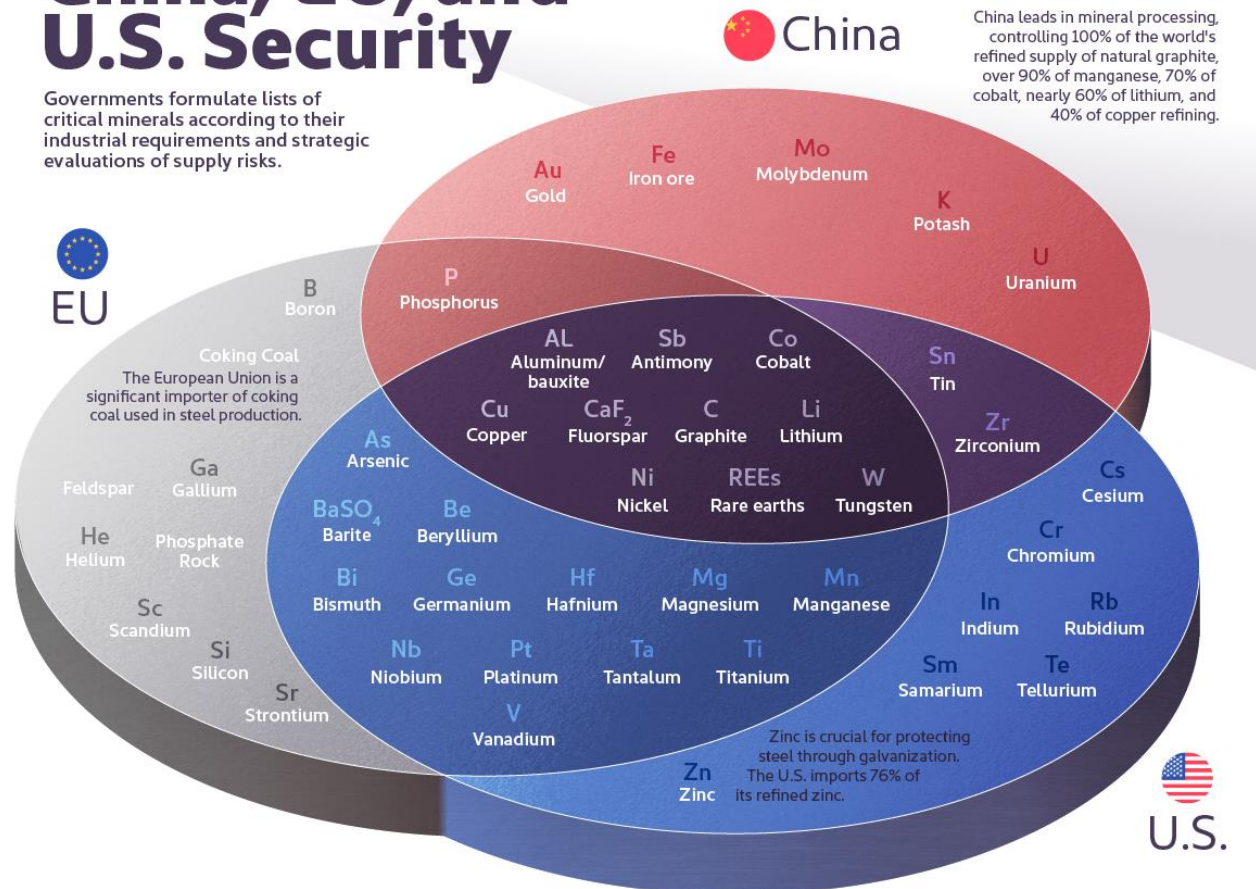

Energy Transition: Critical Minerals and Geopolitics

To meet net zero targets, **we need China**. Same way as we needed RU gas to keep low gas prices. In case of conflicts (for example Taiwan) **implications will be much worse** compared to RU-UA war.

The Critical Minerals to China, EU, and U.S. Security

Governments formulate lists of critical minerals according to their industrial requirements and strategic evaluations of supply risks.

How to start:
From lectures through courses to **EPIC** research

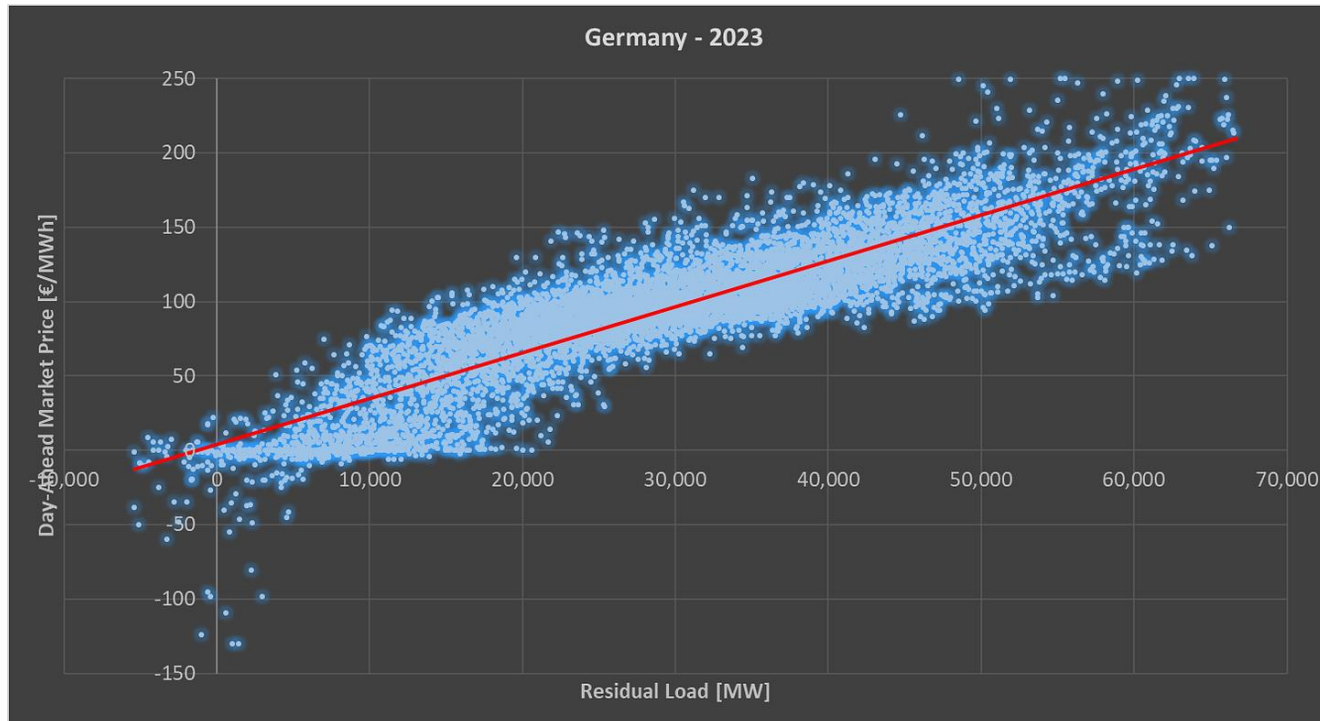

EP Innovation Centre

You don't need much to get started

Add data analytics to your study programmes

Make the most from transparency platform

Understanding power price, future changes and their impact on future power prices

Demand – (Wind + Solar) = Residual Load

You have more than enough data to start, you can also ask for university data licenses

Data services: Energy Charts (free), Commodity Essentials, EnapSys, Kpler, Volue, etc.

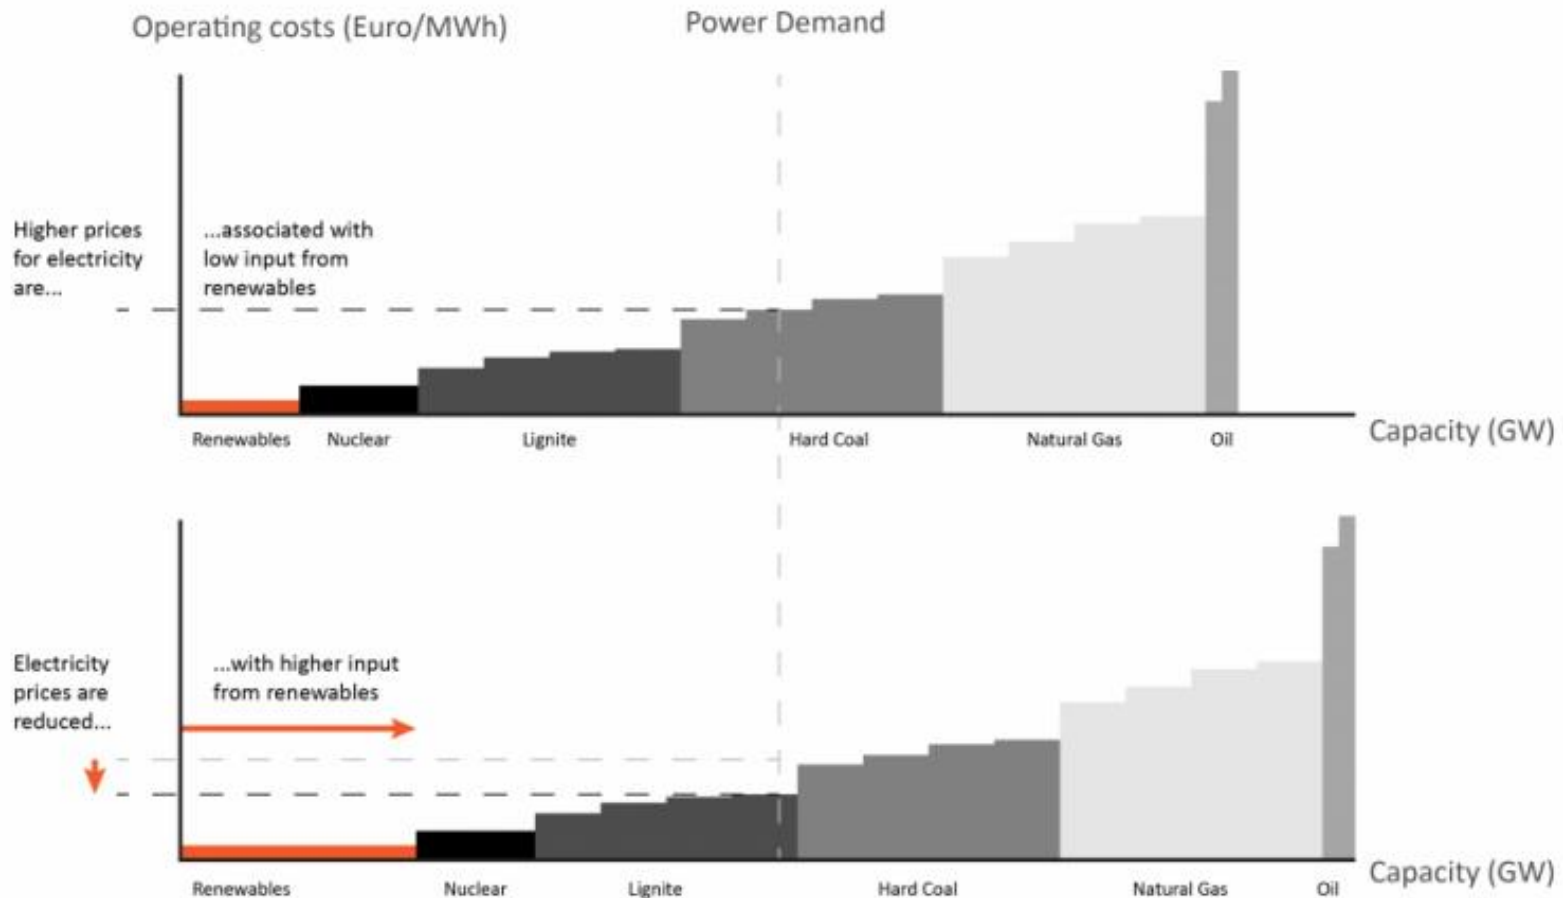

Research terminals: Refinitiv Workspace, Bloomberg terminal, etc.

Many blogs describing recent market events, pricing: <https://gemenergyanalytics.substack.com/>

Free source of data: <https://www.energy-charts.info/charts/power/chart.htm?l=en&c=DE>

Learn how to model things the way we do in business

Stack model (Merit order) - Better way to model non-linear relationship between supply and demand

Build your own model, ask big market players for university cooperation (Aurora, Genscape, Plexos, etc.)

[EUPHEMIA algorithm](#)

https://energy.ec.europa.eu/data-and-analysis/energy-modelling/metis_en

https://energy.ec.europa.eu/publications/metis-1-scripts-and-data_en

Energy Security Framework

BIG PICTURE - How to shape your research to be more interesting for business, EU projects

How to adapt to new market conditions on Supply and Demand side?

More interconnected / volatile market

Supply

- Driver
 - Geopolitics – Energy Security
 - Environment – Net Zero Policies
 - Investment Policies (CFD, PPA, etc.)
 - Emission Policies (ETS, Carbon taxes, etc.)
- Increase
 - Adding more renewables
 - Balancing with no sun, wind, rain
 - Exporting / storing when there is a lot
 - Grid stability
 - Interconnector capacity
 - Grid inertia, RES not directly connected
- Decrease
 - Ageing conventional powerplants
 - Decommissioning thermal generation
 - Cannibalization effect / bidding strategies
 - Negative pricing / inefficient market

Demand

- Driver
 - How much consumers can afford to pay?
 - Price guarantees
- Sectors
 - Residential (LDZ)
 - Delayed response to heating season
 - Climate change / cooling demand increase
 - Power
 - Fuel switching model
 - Less hours where thermal is setting price
 - Changes in underlying commodities and their impact on power prices
 - Industrial
 - Demand reduction = Lower tax income for EU
 - High energy prices = industry relocating production outside of EU
 - EU introducing Carbon import tax

EP Innovation Centre - TECHNICOM

- ❑ **Enhancing Education and Research Quality:** Collaboration aims to elevate the quality of education and research at TUKE and other universities through innovative initiatives.
- ❑ **Skill Development in Commodity Market:** Provides a unique opportunity for students and researchers to acquire valuable skills in commodity market analysis and trading, fostering practical knowledge alongside academic learning.
- ❑ **Centre of Excellence - TECHNICOM Office:** TUKE hosts a Centre of Excellence where talented students can access the TECHNICOM office, equipped with excellent hardware and resources for hands-on learning.
- ❑ **Opportunities for Exposure:** Students and researchers have the chance to visit trading offices in Europe and the UK, gaining exposure to real-world trading environments and networking opportunities.
- ❑ **Empowering Talent:** The collaboration empowers talented students and researchers to excel by providing them with resources, mentorship, and opportunities to thrive in the field of commodities trading and analytics.
- ❑ **Interested? Contact us for more information.**
